Battery Design and Proposal Workshop

Quantum Cognition for Human-AI Decision Teaming

Nathan Yang

M2S2

A Battery for the Service Decision

Question	Consideration	Response
A	Is the convenience valuable?	Yes / No
B	Is the privacy protection adequate?	Yes / No
F	Would you support the launch?	Yes / No

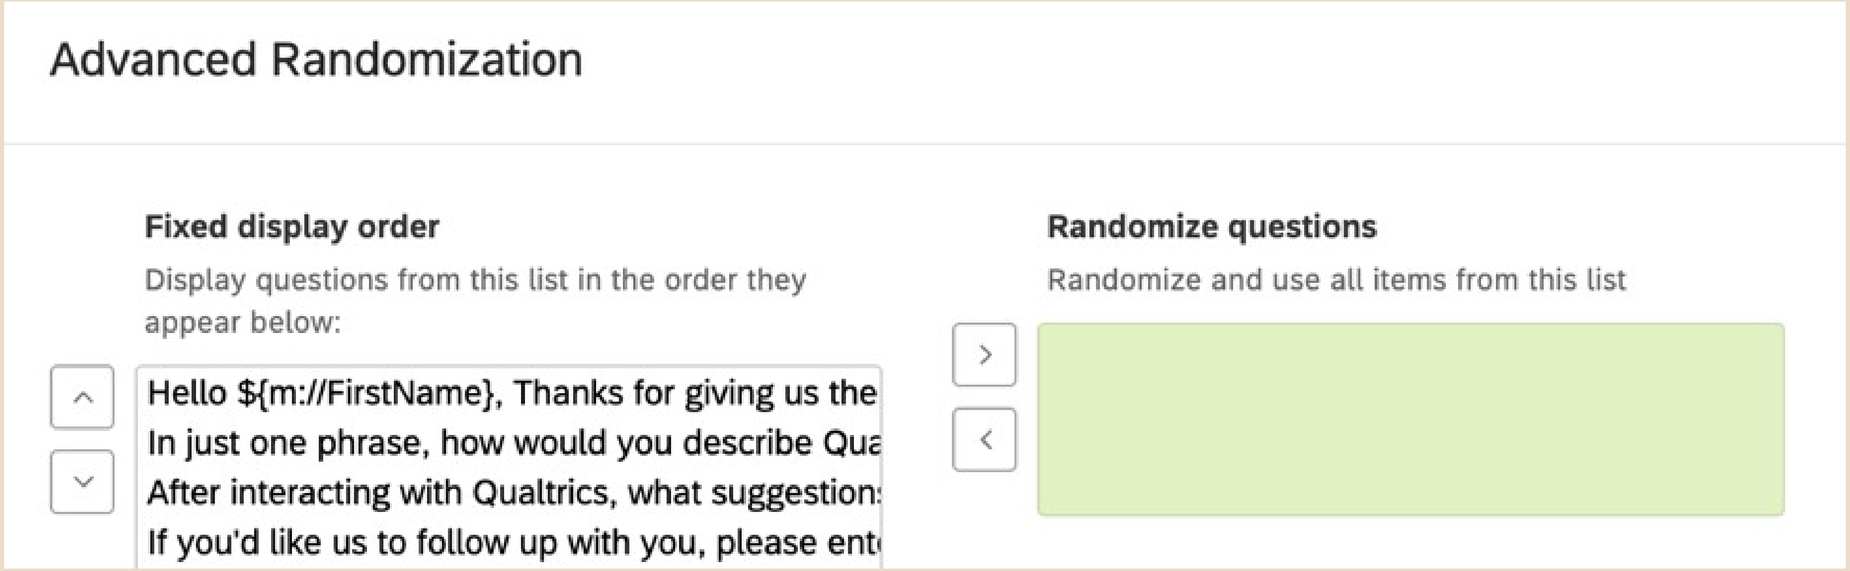

Fictional planning example. Supply the same service facts in every arm.

How would you revise these questions for your company?

Six Conditions, One Persona Grid

Condition	Question sequence	Context retained
Isolated AB / BA	A, B, F / B, A, F	Fresh for each question
Constructed AB / BA	A → B → F / B → A → F	Prior questions and answers
Direct	F only	No prior assessment
Assessed	A → F	Prior question and answer

The Final Question Has a Fixed Position

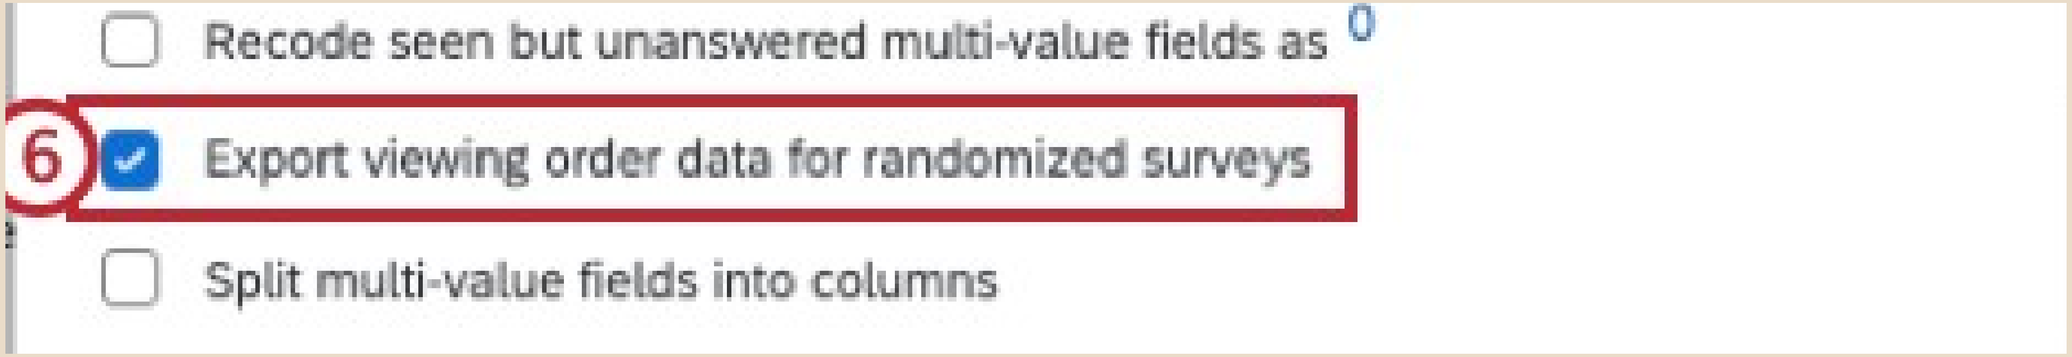

Randomizing questions and selecting a subset change different things.

Which items vary, and which position stays fixed?

Qualtrics documentation: advanced randomization.

The Record of What Each Person Saw

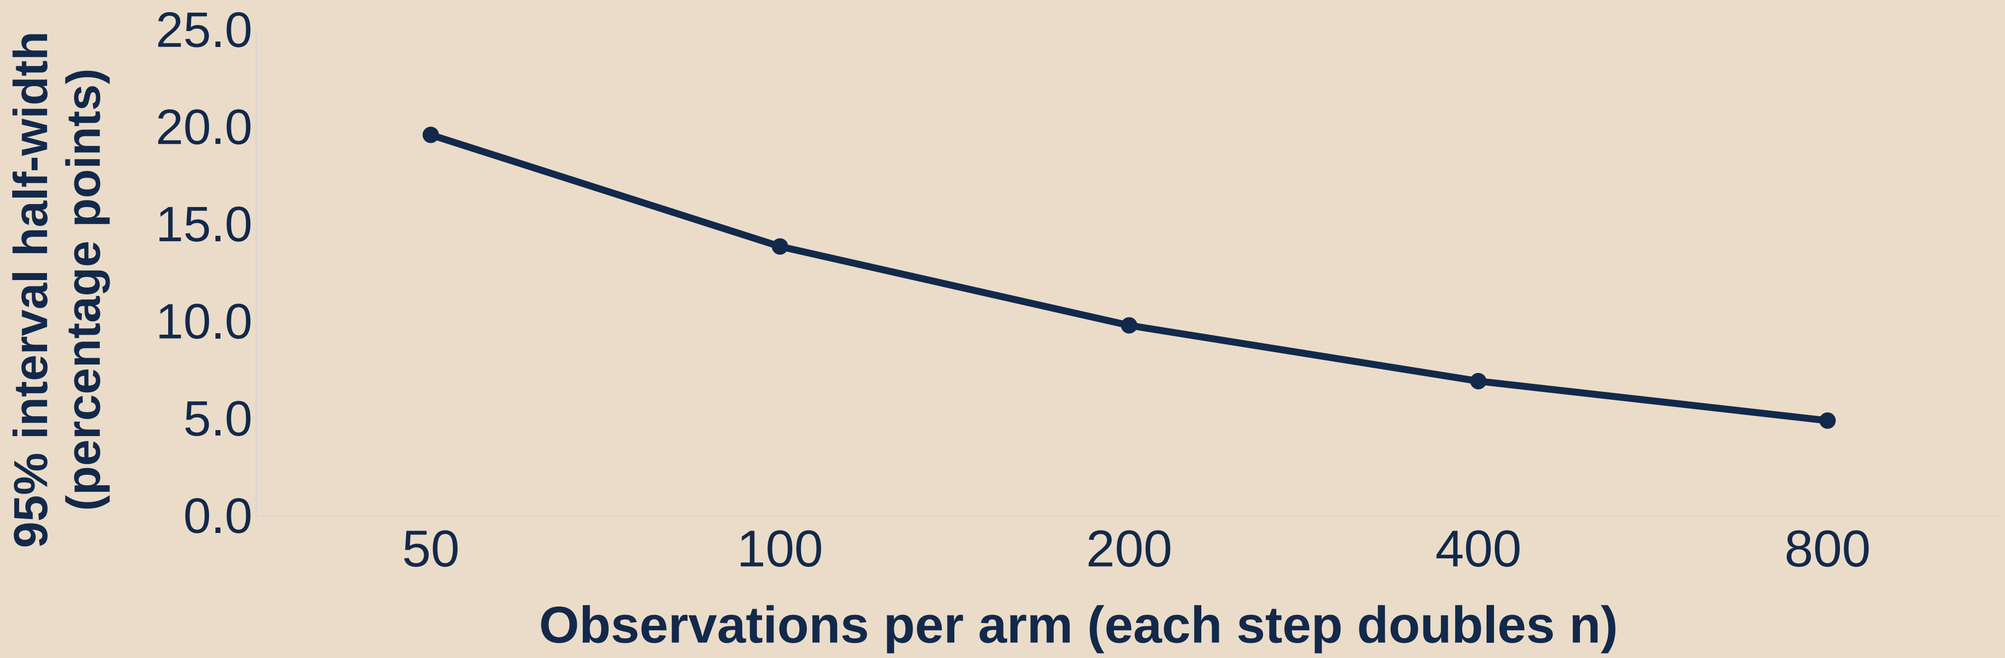

The assigned order and the observed order should agree.

Can your records reconstruct the question sequence?

Qualtrics documentation: viewing-order export.

Precision and the Collection Plan

Planning illustration: two independent arms, each with yes probability 0.50.

How does this uncertainty compare with your practical threshold?

Peer Review Against the Rubric

Find one claim without enough evidence.

Find one design choice that could change the result.

Propose a concrete revision.

Revisions and Their Reasons

Resolve the highest-impact issue first.

Record what changed and why.

Preserve the original prediction for comparison later.

Proposal Submission Check

Attach the proposal, battery, sources, and AI log.

Check the exact Canvas deadline.

Retain a fixed copy before collecting project data.
