Judgment and the Survey Decision

Quantum Cognition for Human-AI Decision Teaming

Nathan Yang

M1S1

The Detection Assumption

What does a detection explanation assume?

What might the act of answering change?

Write one example before discussing it.

The Same Destination, Different Experiences

Which experience comes first may affect the later choice.

A Fictional Service Launch

A company must choose how to introduce a data-enabled service.

One survey leads with convenience; another leads with privacy.

The focal outcome is support for launch.

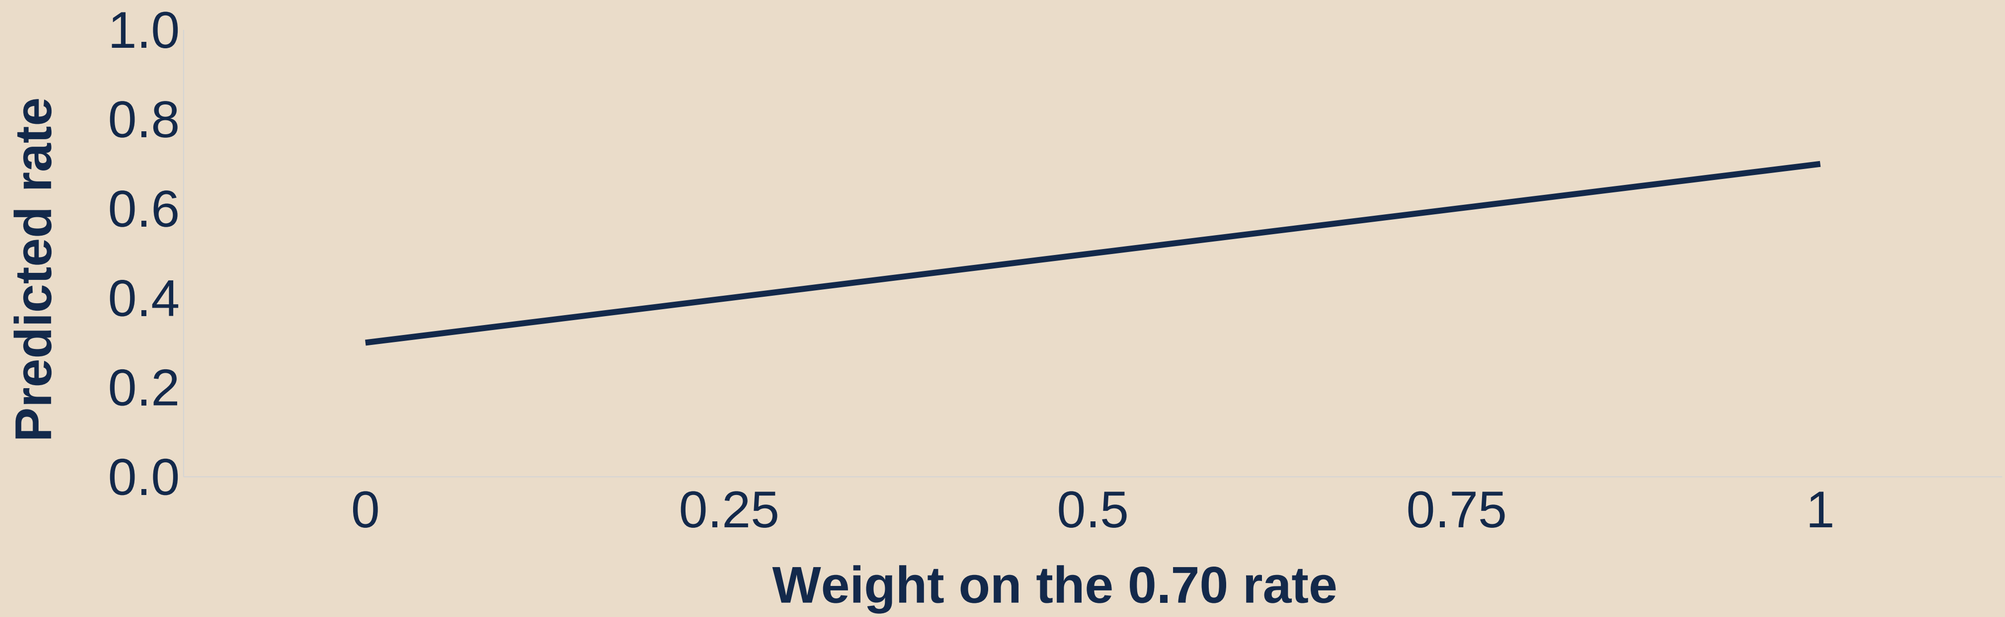

A Fair Comparison

Write the same two questions for both orders.

Keep the same facts and response options.

Specify who answers and how order is assigned.

A Fixed-Rate Benchmark

Imposed conditional rates: 0.30 and 0.70; weights range from 0 to 1.

Can any weighted average reach 0.80?

A Test of the Alternative

Could attention, memory, or learning explain the difference?

What does that explanation predict?

Which new comparison would distinguish it?

A Prediction Before the Result

Choose a new sequence or held-out sample.

Record what each model predicts.

Specify a result that would change your view.

The Discussion Argument

Name the company decision and public evidence.

Explain the response procedure and its hidden assumption.

Propose one informative comparison.

The Next Workshop Step

Retain the draft argument and question wording.

Identify one source or design issue to resolve.

Bring the decision statement to Project Studio 1.
