Audit Workshop and Troubleshooting

Quantum Cognition for Human-AI Decision Teaming

Nathan Yang

M3S2

The Practice Result

Did the calculation recover the simulator’s pattern?

How did the smaller sample change the intervals?

Which warning needs attention?

The Collection Records

Check one complete persona block.

Confirm six conditions and actual retained answers.

Reconcile interview counts with the collection log.

The Audit Calculation

Execute from a fresh notebook state.

Trace one answer-pair table to the input records.

Save estimates, intervals, and diagnostic notes.

An Uncertain Result

Check coding, missingness, and subgroup size.

Examine the frozen thresholds.

Distinguish imprecision from a software error.

Peer Critique of the Evidence

Does each estimate have a clear denominator?

Does the interval preserve the sampling structure?

Does the interpretation stay within Tier 2?

The Result Paragraph

State the tested model, procedure, and outcome.

Report magnitude and uncertainty together.

Connect the finding to a proposed action.

Remaining Work

Save the notebook, records, and revised evidence table.

Log any departure from the proposal.

Assign your next analysis or collection step.
